## Wuhan Municipal Health Commission's briefing on unexplained viral pneumonia

Publisher: Wuhan Health Commission | Release Time: 2020-01-05 20:33:24 | Clicks: 46564 | Font Size: Large, Medium and Small

Since December 31, 2019, our committee has carried out search and retrospective investigation of unexplained viral pneumonia cases in the city. As of 8:00 on January 5, 2020, a total of 59 patients diagnosed with viral pneumonia that meet unknown causes have been reported in our city, including 7 severe patients, and the vital signs of the rest of the patients are generally stable. At present, all patients are isolated and treated in Wuhan medical institutions, and there are no deaths. Of the 59 patients, the earliest onset of the case was December 12, 2019 and the latest onset was December 29; 163 close contacts have been tracked for parallel medical observation, and the tracking of close contacts is still in progress.

Epidemiological investigation shows that some patients are operators of Wuhan South China Seafood City (South China Seafood Wholesale Market). So far, preliminary investigations have shown that no clear human-to-human evidence has been found, and no medical personnel have been found to be infected. Respiratory pathogens such as influenza, avian influenza, adenovirus, infectious SARS and Middle East respiratory syndrome (MERS) have been excluded. The identification of pathogens and traceability of etiology are still in progress.

At present, Wuhan, with the support of the state and Hubei Province, has taken the following main prevention and control measures: First, make every effort to treat patients. Second, carry out isolation treatment for all cases. Third, continue to carry out relevant case searches and retrospective investigations in medical institutions in the city. Fourth, carry out close contact tracking seriously, and implement medical observation for the close contacts that have been tracked in accordance with regulations. At present, no abnormal symptoms such as fever have been found. Fifth, take measures to suspend the market in South China Seafood City, and carry out environmental sanitation disposal and further hygienic investigations. Sixth, actively carry out epidemiological investigations. Seventh, cooperate with the state and the province to carry out pathogen identification (including nucleic acid detection and virus isolation and culture) and etiological traceability, and the prevention and control work is proceeding in an orderly manner.

Experts suggest that at present, our city is in the season of high incidence of infectious diseases in winter and spring. Citizens should pay attention to maintaining indoor air circulation, avoid going to closed and air-ventilated public places and crowded places, and wear masks when necessary. If you have fever and respiratory tract infection symptoms, especially the persistent fever, go to a medical institution in time.
